

AgentForge Real-Data QA Report — 2026-05-31

Executive Summary

Codex acted as orchestrator and reviewer. Implementation and simulator QA were routed through AgentForge subagents:

- Kiro implemented the stale-data fixes and daemon diagnostics endpoint.
- Gemini produced a live-mode simulator QA report using localhost daemon endpoints.
- OpenCode attempted iOS simulator QA with the iOS simulator skill but stalled after a simulator release-build constraint.
- Kiro reran simulator QA with the iOS simulator skill, captured screenshots, and wrote the final simulator evidence report.

Result: **pass with caveats.**

All reachable app screens render, navigate, and no longer show the stale demo values called out in the request. Subagent evidence covers both live pairing with localhost daemon endpoints and deterministic memory-mode pairing. The live ASCP chat/session path was **not fully verified in simulator** because no active session was available to open during the simulator passes.

Code Fixes Reviewed

Area	Result
Settings summary card	Removed hardcoded Muhammad and MacBook Pro · Local ; summary now reads TransportDiagnostics .
Devices screen	Removed hardcoded fallback MacBook Pro · Local , Ubuntu Workstation , fake paired dates, and fake 18 ms ; empty device state now renders when the repository has no trusted devices.

Settings diagnostics	Replaced hardcoded <code>0.1.0</code> and <code>Just now</code> with build-defined app version and diagnostics-derived sync state.
Daemon diagnostics	Added <code>GET /admin/diagnostics</code> ; diagnostics now report the server host and listening state.
Tests	Added/updated widget and repository tests for live diagnostics, unreachable daemon fallback, empty devices, and stale-demo absence.

Verification Matrix

Check	Executor	Result
<code>flutter analyze</code>	Codex verifier	Passed, no issues.
<code>flutter test</code>	Codex verifier	Passed, 162 tests.
<code>npm --workspace @ascp/host-daemon run test</code>	Codex verifier	Passed, 39 tests.
<code>npm --workspace @ascp/host-daemon run build</code>	Codex verifier	Passed, regenerated daemon <code>dist</code> .
<code>flutter_shadcn validate --json</code>	Codex verifier	Passed, 133 components checked.
<code>flutter_shadcn audit</code>	Codex verifier	Passed, registry coverage and files OK.
<code>flutter_shadcn deps</code>	Codex verifier	Passed, required shadcn dependencies present.
iOS simulator health check	Kiro subagent using iOS simulator skill	Passed, 8/8 checks.

Live daemon pairing	Gemini subagent	Passed using localhost:9875 / localhost:9876 ; report recorded pairing code 587450 .
iOS app launch	Kiro subagent	Passed on iPhone 16 Pro simulator.
Pairing flow	Kiro subagent	Passed in memory mode with deterministic code 111111 ; Continue entered trusted shell.
Home tab	Kiro subagent	Passed.
Sessions tab	Kiro subagent	Passed empty-state screen.
Approvals tab	Kiro subagent	Passed empty-state screen.
Devices tab	Kiro subagent	Passed empty-state screen with no demo devices.
Settings tab	Kiro subagent	Passed, shows diagnostics-derived values.
Active session/chat	Kiro subagent	Blocked: memory mode had zero sessions and live ASCP RPC was unavailable.
Stale-data audit	Kiro subagent + Codex grep	Passed for visible UI and source checks.

Stale-Data Audit

These values were not visible in the simulator screens and are absent from production Flutter code:

- Muhammad
- MacBook Pro · Local
- Ubuntu Workstation
- 18 ms
- Paired Apr
- Last heartbeat 4s ago
- 0.1.0
- Just now

The only remaining matches are intentional negative test assertions or report text documenting that the values were removed.

Simulator Evidence

Subagent report:

- `/Users/ibrar/Desktop/infinora.noworkspace/Continuum App/agent-session-control-protocol-ascp/apps/mobile/qa-reports/2026-05-31-gemini-ios-simulator-live-qa.md`
- `/Users/ibrar/Desktop/infinora.noworkspace/Continuum App/agent-session-control-protocol-ascp/apps/mobile/qa-reports/2026-05-31-kiro-ios-simulator-skill-qa.md`

Screenshots:

Accessibility Findings

The simulator accessibility audit found no critical issues, but it reported missing accessibility traits:

- Pairing: 20 warnings.
- Home: 14 warnings.
- Settings: 22 warnings.

Primary issue: Flutter elements are exposed as static text unless interactive controls receive explicit `Semantics` roles. Recommended follow-up: add `Semantics(button:`

true) , labels, and hints to bottom navigation, action cards, pairing OTP cells, and command buttons.

Live Backend Caveat

Live-mode pairing evidence exists from the Gemini subagent using localhost endpoints:

- CONTINUUM_ASCP_RPC_ENDPOINT=http://localhost:9875/rpc
- CONTINUUM_ASCP_WS_ENDPOINT=ws://localhost:9875/rpc
- CONTINUUM_DAEMON_ADMIN_BASE_URL=http://localhost:9876

Kiro's later endpoint probe saw daemon admin endpoints on 8767 and 9876 , while the previous 18787 RPC endpoint was unavailable:

- http://127.0.0.1:18787/rpc : unreachable.
- http://127.0.0.1:9876/admin/pairing/sessions : reachable.
- http://127.0.0.1:8767/admin/pairing/sessions : reachable.

The live pairing surface is covered, but live chat/session detail remains blocked until the daemon has at least one active session available for the app to open and stream.

Final Verdict

Pass with caveats.

The stale-data cleanup is complete for the reachable app UI and production Flutter code. Settings/devices now read repository and diagnostics state instead of stale demo values. Simulator QA verified live pairing, memory-mode fallback pairing, and all reachable tabs with screenshots. The remaining gap is a true live ASCP chat/session verification pass, which requires seeded or real active sessions.
